

BURNDY® Braid Right On Down the Line

When a transit authority in the United States had an order for 12 heavy locomotives, they needed one connector that would meet two criteria: *Be made in the USA and be proven to meet certification guidelines.*

For this project, BURNDY presented drawings for a flexible copper braid that would be manufactured at our Littleton, New Hampshire, facility. BURNDY also fully tinned the braid to the required specifications, all while maintaining UL Listing and CSA Certification.

The result met the requirements for the transit authority's taxpayer-funded project and delivered a higher amperage rating to meet certification guidelines.

Don't let a connector challenge derail your project. With BURNDY, we can all keep moving forward.
